

DELIVERY & FACILITATION PLAYBOOK

How to carry the room — presence · movement · gestures · student support

Factoring Trinomials Model Lesson · Waltrip HS · Vigneshwar Lokoji

Your script tells you **WHAT** to say. This tells you **HOW** to deliver it — where to stand, when to move, what to do with your hands, the silent signals you keep, and exactly how to reach a struggling student and stretch a fast one. In a model lesson the panel scores your **PRESENCE** as much as your math. Own it.

1. Your Presence Baseline *hold this the entire 15–20 minutes*

Channel	Do this — every minute
Voice	Project to the BACK wall. Vary it: drop low and slow for the “stamp,” lift bright for transitions. Never trail off at the end of a sentence.
Pace & wait time	After every question, SILENTLY count to 3 before taking an answer. Silence is a tool, not a gap — it makes everyone think.
Stance	Feet planted shoulder-width, weight even, shoulders square to the class. Move with purpose, then PLANT. No nervous pacing or rocking.
Hands	Open palms, visible, above the waist. Gesture to the math (see §3). Never: crossed arms, hands in pockets, pen-clicking, or pointing one finger at a student.
Eyes	Scan the whole room in a “W” — front-left, back-left, center, back-right, front-right. 2–3 seconds per student. Deliberately include the far right and the back corners.
Face	Smile genuinely at the start and at every success. Nod to affirm. Your face tells them math is worth being excited about.
Energy	Pitch it one notch ABOVE what feels natural. Enthusiasm is contagious; flat is forgettable. The panel reads energy as classroom-culture potential.

2. The Movement Map *when to walk, where to stand — the release made physical*

Match your **FEET** to the phase. As responsibility shifts from you to them, your body shifts from the front into the room.

Phase	Where your body is	Why
I DO (model)	Anchored front-and-center, near the screen. This is the ONE time you own the space. Step to the screen to point at the X-puzzle; otherwise stay still.	All eyes on the thinking. Movement now is a distraction.
WE DO (guided)	Step OUT from the front into the aisles. Walk among them during turn & talks; crouch beside pairs.	Your body signals “the work is yours now.” Proximity invites participation.
YOU DO (independent)	Start the timer, then GO SILENT and CIRCULATE a full loop — including the RIGHT side and back corners. Do not hover at the front.	You are collecting data, not teaching. Coverage = every student is seen.

► **Anchor & release:** PLANT when you want attention — give instructions standing still, point to the posted LO/EQ. Move only when they’re working.

► **Proximity, not callout:** drift toward an off-task student WHILE still addressing the class. Proximity alone resets behavior — no callout, no broken momentum.

► **Cover the whole room:** plan your loop so you pass EVERY desk at least once during You Do. Mentally tick names; consciously reach the quiet and the right-hand side (panels notice a teacher who favors one side).

3. Hand-Gesture Vocabulary *make the math visible — repeat these so they become memory hooks*

Gesture	Say it when...	What it looks like
PRODUCT (c)	"...multiply to c — the TOP of the X."	Two fists / palms come TOGETHER and meet. Combine = multiply.
SUM (b)	"...add to b — the BOTTOM of the X."	Two flat hands side-by-side slide together; or count on fingers.
The X (signature)	Any time you name the puzzle.	Trace a big X in the air with both arms. Tap HIGH = product, LOW = sum, LEFT/RIGHT = the two numbers. Make this your trademark.
Counting pairs	"1 and 12... 2 and 6... 3 and 4..."	Hold up fingers, one pair at a time. Makes the search visible and finite.
Signs	"What sign does it get?"	Thumb UP = +, thumb DOWN = -, hand TILT = "mixed, one of each."
The STAMP	"c is the product, b is the sum."	Firm downward palm-tap, like stamping the desk/air. Physicalize the key point so it sticks.
Invite an answer	Cold-calling or taking a hand.	OPEN palm toward the student (never one finger). Respectful, inclusive.
Build the binomial	"...so it factors into two parts."	Two hands form two "()" brackets in the air.

► **Avoid:** finger-pointing at individuals, arms crossed, hands in pockets, fidgeting with a marker, turning your back while talking.

4. Silent Signals & Indicators *manage and check without stopping the lesson*

Signal	How to run it
Attention-getter	Raise one hand + "Track me in 3 — 2 — 1." Establish it in the first minute; use the SAME cue every time so it becomes automatic.
Silent countdown	Hold up 5 fingers and fold them down to signal a turn & talk is wrapping (5...4...3...2...1, eyes up).
Whiteboards UP	Flat palm, lifted. Introduce it on the Do Now so by You Do it's a reflex. "Boards up" = instant whole-class data.
Thumbs / response cards	Thumb up = "got it," sideways = "shaky," down = "lost." A 2-second temperature check that finds who needs you — no one has to speak.
Wait time	Ask → hold a visible 3-count pause → then take answers. Resist filling the silence. It signals "everyone thinks," not "fastest hand wins."
"Hold that thought"	Gentle flat-hand stop. Use it to enforce THINK-before-talk, especially before a turn & talk or during You Do.

5. How to Approach & Support a Student *the choreography for We Do / You Do circulation*

When you reach a stuck student, run this five-step move — it takes ~20 seconds and the panel reads it as pure student-centered teaching:

1. **Get to eye level.** Kneel or crouch beside the desk — never loom over them. Non-threatening, private, equal.
 2. **Read first, then speak.** “Show me what you have.” Look at their work for 2 seconds before you say anything.
 3. **Ask, don’t tell.** ONE targeted question that unsticks them — “What two numbers multiply to 12?” → “Which of those adds to 7?” NEVER take the pencil or give the answer.
 4. **Leave a step + exit.** “Try that pair — I’ll be back to check.” Don’t camp at one desk; you owe the whole room your time.
 5. **Return to verify.** Close the loop. Coming back says “I expected you to do it, and I care that you did.”
- **Tone:** warm and low (private). Affirm effort: “Good thinking — keep going.” Mistakes are data, never failures.
- **Fast finishers:** hand them the Challenge Zone — “Climb as high as you can, and PROVE each one by expanding.” Or deploy them: “Go confirm your neighbour’s signs.” No one sits idle.

6. Differentiation in Action *three tiers, one shared X-puzzle (low floor, high ceiling)*

Tier	Who / what they get	Your move
SUPPORT	Not yet fluent. The X-puzzle template, the factor-pairs list, the sign chart, sentence stems, and the “STUCK?” ladder on the handout.	Kneel, ask one question, offer the stem “two numbers that multiply to ____ and add to ____.” If still stuck: “I do one, you do one.”
ON-LEVEL	Most students. The four You-Do / exit problems.	Peer support in We Do, cold-call + turn & talk, “whiteboards up” for data.
STRETCH	Fast finishers. The Challenge Zone: bigger numbers → difference of squares → $a \neq 1$ → create-your-own.	“Convince me.” “Prove it by expanding.” Promote to peer tutor.

- **Emergent Bilinguals (ELPS):** front-load vocabulary (factor, product, sum, binomial), keep the X-puzzle visual, give sentence frames, and use partner talk so they rehearse language before writing.

7. Voice & Questioning Techniques *how rigor and engagement actually happen*

- **No-opt-out:** if a student says “I don’t know,” get the answer from another student, then RETURN and have the first student repeat it. Nobody opts out.
- **Cold call (with warmth):** call non-volunteers by name — but only after wait time and turn & talk, so it’s safe, not a gotcha.
- **Turn & talk choreography:** always state PURPOSE + TIME (“30 seconds — convince your partner WHY both signs are positive”), signal start, circulate to listen, signal stop, then harvest 1–2 voices.
- **Revoice & stamp:** repeat a student’s correct reasoning back to the class, then have EVERYONE say the stamp aloud. Their words become the anchor.
- **Press for justification:** “How do you KNOW?” / “Convince me.” This single move is where grade-level rigor lives — push for the WHY, not just the answer.

8. Slide-by-Slide Presence Cues *a quick body-and-gesture map (pair with the word-for-word script)*

Slide / phase	Your body & gesture	Watch / move
1-2 Title + Flow	Front-center, big smile, strong voice. Tap the three pills I DO→WE DO→YOU DO; trace the release arrow.	Set the tone in 60 sec. Don't teach math yet.
3 Do Now	Plant, give the task, then CIRCULATE. Introduce "whiteboards up" here.	Glance at boards — who already gets FOIL?
4 Objective + DOL	Point physically to the posted LO and DOL. Slow, deliberate voice.	Name the goal; they should know what success looks like.
5 Notice / Connect	Open-palm invite; take 2-3 voices. Nod and revoice.	Low-stakes — get everyone talking early.
6 I DO (model)	ANCHOR front-center. Think aloud. Use PRODUCT, SUM, the X, and the STAMP gestures. Keep it under ~3 min.	Model THINKING, not speed. Name each decision; resist solving fast.
7 Sign chart	Point to each row; thumb up/down for signs. Call it a tool that will EXPIRE.	Brief — it's a scaffold, not a lecture.
8-9 WE DO	Step OUT into the aisles. Cold-call each blank (open palm). Run the turn & talk choreography. Crouch beside pairs.	Ask, don't re-model. Listen for sign reasoning. Watch right-pair/wrong-sign.
10 YOU DO	Start timer → GO SILENT → circulate the full loop (right side too). Use the 5-step approach for stuck students.	Protect the silence. NO rescue. Tick names. Deploy Challenge Zone to fast finishers.
11 Exit Ticket	Hand it out, stand back, let them work. Narrate to the panel how you'll sort the data.	Collect = DOL. Note who misses which sign case.
12 Debrief + Stamp	Back to front-center. Cold-call the sentence frame; everyone says the STAMP aloud (palm-tap).	Thread the objective start-to-finish.
13 Close	Warm, square to the panel. Thank them by name.	Confidence + professionalism.

9. Reading the Room — Quick Tells *what to look for and what to do*

You see...	Do this
Blank board, copying a neighbour, eyes down, pencil parked	A student is LOST. Approach with the 5-step move — one question, leave a step, return.
Done fast, looking around, restless	A student is AHEAD. Hand them the Challenge Zone or make them a peer tutor.
Many wrong on "boards up" (e.g., right numbers, wrong signs)	WHOLE-CLASS gap. Pause, re-ask ONE targeted question (don't re-teach from scratch), re-anchor to the sign chart, move on.
Side conversations / drift	Use PROXIMITY — walk toward them mid-sentence. Reinforce a nearby positive by name. No public callout.

10. High-Stakes Moments

- **First 60 seconds:** smile, plant front-center, clear strong voice, state who you are and what they'll be able to DO. This sets the whole observation.
- **Transitions:** crisp and signaled — "In 3-2-1, boards up." Sloppy transitions are where culture points leak away.
- **The You-Do silence:** the hardest discipline of the lesson. Don't fill it, don't rescue. Circulate and collect. Afterward, TELL the panel what you learned from the data.
- **Last 30 seconds:** return to the LO/EQ, whole class says the stamp, thank the panel warmly and by name.

FIVE MANTRAS — say them to yourself before you walk in

“Model thinking, not speed.”

“Ask, don’t tell.”

“Plant to talk, move to coach.”

“Protect the silence — no rescue.”

“c is the product, b is the sum.”
